

LPG

When you opt to power your Commodore Omega sedan, with an LPG V6 engine, you can look forward to fuel running costs comparable to that of many popular smaller cars that run on petrol. It's an obvious win-win. You enjoy all the comfort and roominess of a large vehicle, retain all the safety features that come standard on the equivalent petrol model, and yet still seriously cut your fuel expenditure. Indeed, with both petrol and LPG tanks full, you could drive over 1,100km* without needing to pull into a service station.

Holden's latest Generation 5 LPG system, known as Sequential Vapour Gas Injection, has lifted the bar on gas performance. Now the factory-engineered Holden system injects the gas directly into the inlet port, mimicking a traditional petrol system. This (along with other high tech solutions) have overcome issues associated with performance and reliability. Disruption to electronic systems - such as traction control, on-board diagnostics and rev limiters - no longer exist.

Holden's LPG Dual Fuel system allows your vehicle to automatically and seamlessly switch between petrol and LPG, starting on petrol and reverting back to LPG when the optimal temperature is reached.

*Calculated using ADR 81/01 fuel consumption figures of 13.4L/100km (LPG) and 10.3L/100km (petrol) and two tanks of 73L capacity in a Commodore Omega sedan. Fuel consumption will depend on many factors including your driving style, the prevailing conditions and your vehicle's equipment, condition and use.

Omega Sedan LPG

Operational

- Available in sedan only
- 3.6 litre Dual Fuel LPG V6 engine
- 4-speed automatic transmission
- 16" alloy wheels (4)
- Electronic Stability Control (ESC)
- 6 airbags including: front and side impact airbags for driver and front passenger and side curtain airbags
